

Drug Abuse EDA

Project Submission- DSI Immersive – Pramod Paul

Goal/Objective

- EDA for Drug abuse CSV
- EDA for SAT score CSV (not covered in this ppt)

Drug Abuse CSV

CSV file – initial thoughts

- 13 drugs, 17 age groups
- Median percent use for each drug in sample
- Number of samples for each age group

Story behind the data

Investigate

Mental
health and
Wellbeing

By
reviewing
drug abuse
(Class 1 -5)

Across all
age groups

EDA

Step 1

- a) Replace missing values with np.nan (zero not used to avoid skew)
- b) Convert numeric values to float
- c) Alcohol values removed as this skews the results

EDA

Step 2a

Weighted
Median
frequency for
each drug

Convert median freq to weighted
median value as shown below

Marijuana-Frequency

Marijuana percent use * n

n = sample size

(Had to convert zero values to np.nan to
avoid infinity values- (division by zero))

EDA step 2b:

Classify drugs by
prescription
drugs category
in USA

Controlled
Substances Act

Class 1 (Type 1): Illegal because they have high abuse potential

Marijuana, Heroin, Crack, Cocaine,
Hallucinogen, Stimulant, Tranquilizer

Class 2 (Type 2): High potential for abuse and dependence, an accepted medical use, and the potential for severe addiction.

Oxycontin, Meth, Sedative

EDA step 2b:

Classify drugs by
prescription
drugs category
in USA

Controlled
Substances Act

Class 3: Lower potential for abuse than type 1 and 2, accepted medical use, and mild to moderate possible addiction.

None in our data

Class 4: Even lower abuse potential than type 3 drugs, accepted medical use, and limited addiction potential.

None in our data

EDA step 2b:
Class 5

Step2c:
Add all median
weights by class

Step2d: Clean up
age values

Class 5: Low abuse potential, accepted medical use, and a very limited addiction potential. **Inhalant & Pain-reliever**

Step 2c: Add all median-wts by class

Step2d:

- a) Convert age to float.
- b) Take average of values where two are given.

In [191]: 1 dfDrugFiltN

Out[191]:

	age	Class1_med_wt	Class2_med_wt	Class5_med_wt
--	-----	---------------	---------------	---------------

0	12.0	0.000000	11.079342	1.067727
1	13.0	0.000000	23.576351	0.385685
2	14.0	0.000000	11.953797	0.179083
3	15.0	3.987784	3.848106	0.135933
4	16.0	0.000000	4.533563	0.069622
5	17.0	28.295754	3.202295	0.100685
6	18.0	6.026432	2.151383	0.142834
7	19.0	16.661103	12.932973	0.153822
8	20.0	2.943761	1.250205	0.161456
9	21.0	3.886416	1.857177	0.131488
10	22.5	1.514697	7.371166	0.116847
11	24.5	3.228928	2.894459	0.090757
12	27.5	4.138423	2.711187	0.313277
13	32.0	7.510633	7.371198	0.435713
14	42.0	40.032110	8.027782	0.489656
15	57.0	21.563416	17.397400	1.842977
16	72.0	0.000000	0.000000	1.633987

In [188]: 1 dfDrugFiltN.dtypes

Out[188]: age float64

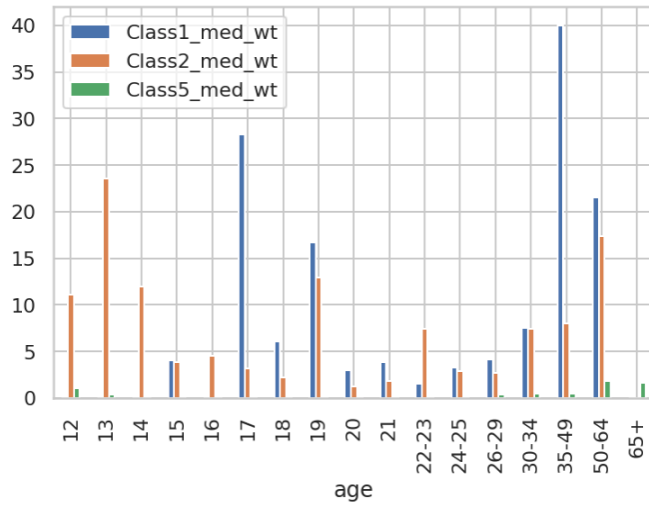

In [94]: 1 dfDrugFiltN.groupby('age').plot(kind='bar', x = 'age', sharey= True)|

```
In [94]: 1 dfDrugFiltN.groupby('age').plot(kind='bar', x = 'age', sharey= True)
```

```
In [94]: 1 dfDrugFiltN.groupby('age').plot(kind='bar', x = 'age', sharey= True)
```

EDA:

Null &
Alternate
HYpothesis

NULL HYPOTHESIS:

- All other things being the same, abuse using Class 2 drugs is same for all age groups than Class 5 drugs

ALTERNATE HYPOTHESIS:

- All other things being the same, abuse using Class 2 drugs is different/greater for all age groups than Class 5 drugs

EDA:

Two sample
test:

- Two sample test: Comparing two means
- Unpaired data: Data from each of the samples independent of the other
- Goal: Compare responses from each group

EDA:

Two sample
test:

- Class 2 (experimental) and Class 5 (control) were chosen as they were prescription drugs
- Using Class 1 would have skewed the result.
- `stats.ttest_ind(experimental, control)`
T- statistic=4.32,
P-value=0.000140

EDA:

Cross check by
stats.t.cdf

```
lower_tail = stats.t.cdf(-t_stat, (size +  
size-2), 0, 1)
```

```
upper_tail = 1. - stats.t.cdf(t_stat, (size +  
size -2), 0, 1)
```

```
p_value = lower_tail+upper_tail
```

```
pvalue=0.000140
```

Null
Hypothesis :
Rejected

- All other things being the same, abuse using Class 2 drugs is different/greater for all age groups than Class 5 drugs

High values for age groups 34-49 & 50 -64 similar to age groups 17 and 19

Recommendations

- For age groups, 35 -49 & 50 -64, Doctors to take care to prescribe the class 2 medication in limited quantities and to prescribe only if it is essential.
- Monitor patient behaviour and wellbeing for drug abuse cases.
